PINTAR

Learning, evidence, and decisions that stay human.

A presentation for management and educators

Do we really know what is happening inside the learning process?

Not how much was completed. What was actually understood.

PINTAR helps us understand what is happening in the learning process — based on the available evidence — so people can make better decisions.

The same four questions, for everyone: What is happening? · What does the evidence support? · What should I look at next? · What can I do?

The learning cycle, in five steps

PEMETAAN AWAL
Initial Mapping

Where should learning begin?

→

PETA BACAAN
Reading Map

What should be read first?

→

PELAJARAN
Lessons

Learn through the assigned material.

→

UJI PENGUASAAN
Mastery Check

What can now be demonstrated?

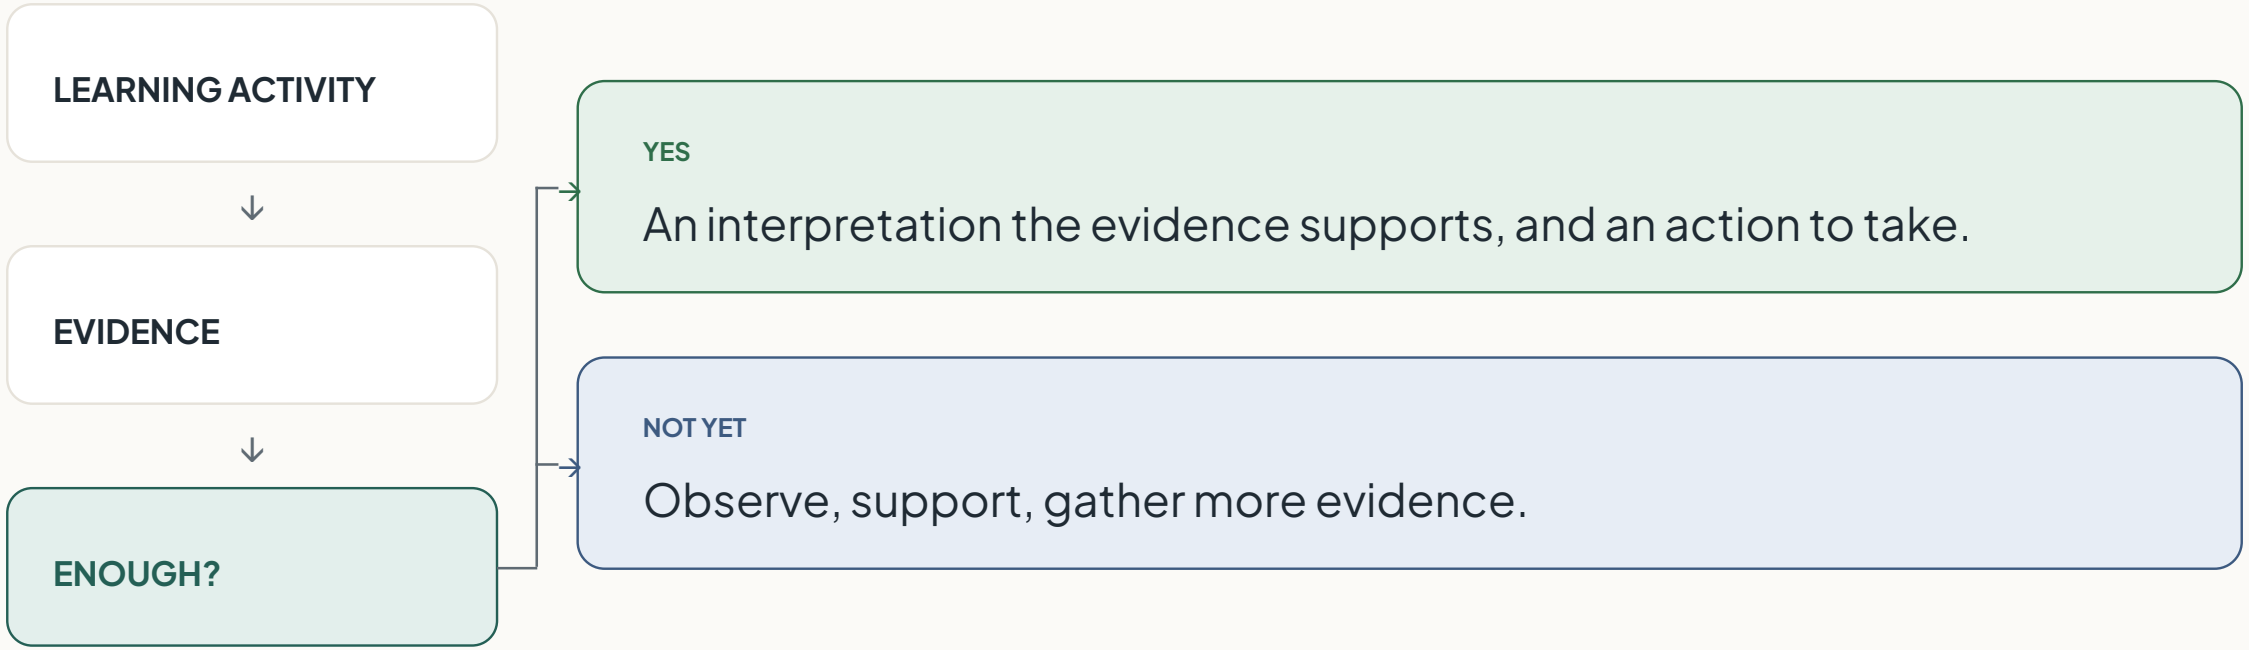

→

HASIL
Results

What does the evidence support?

> Initial Mapping and the Mastery Check never use the same questions, and never use their twins either.

The question asked first, every time: is there enough evidence?

Not every activity becomes a conclusion, and no conclusion is forced.

“Not yet enough evidence” is not “not good enough”.

NOT YET ENOUGH EVIDENCE

We do not know yet.

- Not a judgment about the person.
- A valid, honest state.
- It changes as evidence arrives.

NOT YET MEETING THE STANDARD

A conclusion the evidence supports.

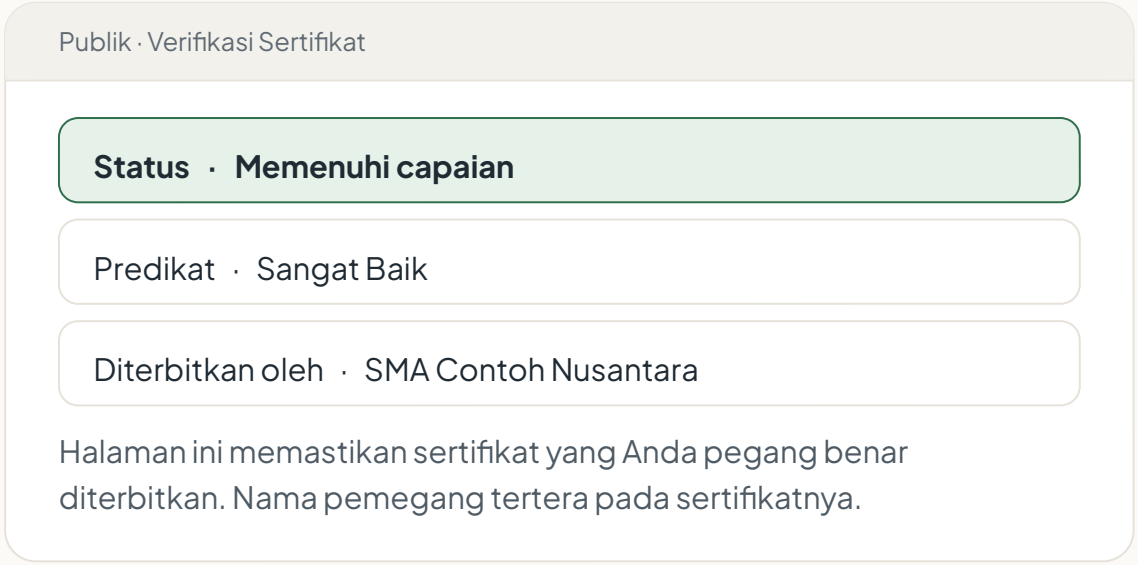

- The evidence is sufficient.
- There is a clear next step.
- Still “not yet”, never “no”.

Inside the product: “Belum cukup bukti untuk menilai soal ini.”

NOT YET ≠ NO

A certificate anyone can check.

A certificate issued by the school can be verified at one official address, with no login.

ONLY WHAT IS NEEDED

The public page shows no score internals and no personal data.

BOUND TO THE CONTENT THAT WAS TAUGHT

The certificate names the exact version of the material. Altering any field it attests to makes verification fail.

ONE VERIFICATION ROUTE

There is exactly one official address, and older certificates stay checkable after a key rotation.

Layout reconstructed from the built PINTAR interface. The on-screen wording is the product's own. The interface is shown in Indonesian, the product's own language.

AI helps interpret. People still decide.

EVIDENCE
What actually happened.

→

PATTERN
What recurs.

→

INTERPRETATION
What it might mean.

→

ACTION
What could be done next.

→

HUMAN DECISION
This one is never replaced.

> Every suggestion must survive one question: why? PINTAR must be able to show the evidence it used, how it read that evidence, and what remains uncertain.

AI proposes. PINTAR validates. Humans govern. No AI can publish content or assign it to learners, and learner-facing help is produced with no access to answer keys.

What changes

THE LEARNER

Knows what to do now.

Sees their own progress, not a rank.

Never meets a dead end.

THE EDUCATOR

Knows what is most worth doing first.

Opens an assessment unaided, in minutes.

Receives evidence to interpret, not a verdict.

MANAGEMENT

One picture, every number meaning the same thing.

Knows where attention is needed, and where evidence is not yet enough.

Responsibility stays with people.

PINTAR does not automate the educator. It removes unnecessary workload, so an educator's time goes back to what only a person can do.

Technology helps us see more clearly. The decision remains ours.

Calm on the surface. Rigorous underneath.

The boundaries we acknowledge today

Stated so nothing here is mistaken for a promise.

1. The core is complete. Production readiness is not declared.
2. Load and stress validation is not finished.
3. Validation with real educators and learners is still ahead.
4. Parts of the management experience are still being developed; no management screen is shown today.
5. The accreditation framework, retention periods and the transfer policy remain open.
6. Some engineering questions remain, and are recorded.

> This presentation promises nothing beyond the list above.
